

Survey on skin microbiota

All of us have a skin microbiome. This means that the bacteria on the outside of our skin generally help keep our skin healthy and happy. However, imbalances in the skin microbiota can lead to problems such as acne and eczema. An imbalance in skin microbiota is not always the cause of these problems, but does contribute to the number of people suffering from skin related problems. The iGEM Stockholm team of 2021 would like to develop a test to conclude on imbalances in skin microbiota. For this, we need your opinion! Thank you for taking the time to fill out this survey for us.

Do you ever experience skin problems (e.g. acne, eczema)? *

Yes

No

If so, what kind of problems?

Ditt svar

How does your skin make you feel and if it is in a bad state affect your day to day life? *

- It leads to insecurity: I will hide it using make-up, a beard, my hands
- It does not affect me at all
- It affects me a little bit; I feel bad when I see it, but forget about it soon thereafter

Would you want to know if the state of your skin is linked to your skin microbiota? *

- Yes
- No
- Maybe

If a quick test for detection of a microbial imbalance on the skin existed, would you want to use it? *

- Yes
- No
- Maybe

Would it help you to know any skin problems you have might be due to an imbalance in skin microbiota? *

- Yes
- No
- Maybe

Do you have anything else you want to tell us concerning your skin and the possibility of a microbial skin imbalance?
